Cross-agent Context

What the next agent is allowed to remember

A review brief can be perfectly accurate and still be the wrong brief for its recipient. A release owner may read the private report that produced a test result. A contractor reviewing the patch may be allowed to see only the result. Passing the whole transcript would silently change the audience.

Build the brief around a revision

Start with the requester's own words. Attach the candidate revision and the check that ran on it. Include the outstanding decision and the path to its evidence. If the first worker deleted a temporary input, identify the captured revision that the next reviewer may recover. Each item answers a question the next operator would otherwise have to ask.

The Interposer's context relay gathers project instructions, rules, recent changes and sourced facts at startup or compaction. Its continuation prompt can identify remaining tasks and a diff. A human can examine the brief before deciding what the next worker inherits.

Check access at both ends

In the work-platform design the receiving identity determines the results it may search, rank and preview. Recheck access when fetching the source. A brief may outlive a revoked grant or a document whose audience has narrowed. A reference can survive in the history while access to the underlying bytes changes.

Keep findings, decisions and policy distinct. A worker's "we should skip this flaky test" is a finding somebody can inspect. Making it an operating rule needs a named owner and a separate decision. Preserve the original observation so the next engineer can disagree with it.

Give the reviewer a five-minute exercise

Pass a fixed patch, one failed check and a brief to a different review model. Ask it which revision failed and what evidence supports the answer. Repeat with a receiving identity that lacks access to the source document. Check the snippets as well as the final fetch. A good handoff preserves the work, its uncertainty and the limits of the next assignment.

An evidence packet for the second worker

Include	Tie it to	Ask the recipient
The requester's words	The named job and sponsor	What question are you here to answer?
The patch and last check	The revision actually tested	What changed after the previous test?
The finding and its source	An evidence reference with the permitted audience	Which observation supports your conclusion?
The open decision	The owner who can settle it	What is outside this assignment?
